On average,
every 2 MINUTES a
woman is diagnosed
with breast cancer
in the United States.

1 IN 8 WOMEN (approximately 13% of women) in the United States will be diagnosed with breast cancer in her lifetime. In 2023, an estimated 297,790 women and 2,800 men will be diagnosed with invasive breast cancer. Chances are, you know at least one person who has been personally affected by breast cancer.

In Mexico, breast cancer mortality has steadily increased over the last three decades making it the **leading cause of cancer death among women.** 

1 IN 5 BLACK WOMEN with breast cancer are diagnosed with triple-negative breast cancer, which is harder to treat. This is higher than any other racial or ethnic group.

On average, a woman with a BRCA1 or BRCA2 gene mutation has up to a 7 IN 10 CHANCE OF GETTING BREAST CANCER BY AGE 80. This risk is also affected by how many other family members have had breast cancer. (It goes up if more family members are affected.)

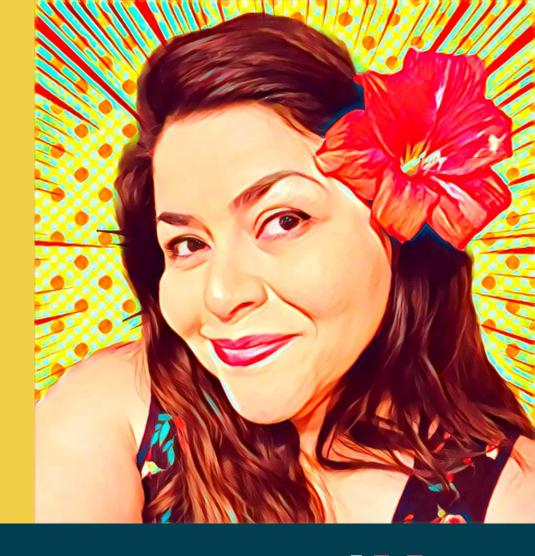

## The All of Us Research Program and Breast Cancer Research

Despite advances in screening, prevention, and treatment, more than 40,000 women still die of breast cancer each year in the United States. Using the All of Us Research Program's diverse and expansive dataset, researchers are working to create a more personalized, risk-based approach to breast cancer screening that could help decrease the impact that breast cancer has on women and families and improve outcomes for those affected.

## BREAST CANCER AWARENESS MONTH 2023

This October, join us to raise more than awareness as we take action, support one another, and help women now.
